

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The UDP protocol reveals that: to retrieve an IP address from the DNS server for the website yummyrecipesforme.com was unsuccessful.

This is based on the results of the network analysis, which show that the ICMP echo reply returned the error message: destination port unreachable.

The port noted in the error message is used for: DNS protocol traffic which indicates an issue with DNS server.

The most likely issue is: that ICMP error response about port 53 is that the DNS server is not responding.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

Time incident occurred: 1:24pm

Explain how the IT team became aware of the incident: Several clients reported that they were not able to access the client company website yummyrecipesforme.com, and saw the error 'destination port unreachable'

Explain the actions taken by the IT department to investigate the incident: cybersecurity analyst tasked with analyzing the situation and determining which network protocol was affected during the incident.

Note key findings of the IT department's investigation (i.e., details related to the port affected, DNS server, etc.): to investigate the issue tcpdump used packet sniffing for tests. In the log it was found that DNS port 53 is unreachable. Possibly firewall blocks traffic to port 53 or DNS server is down.

Note a likely cause of the incident: The DNS server may be down due power outage, misconfiguration or DoS attack.
